LearnPython Tutorials Part One

Use the "print" function to print the line "Hello, World!".

script.py

```
1 print("Hello, World!")
```

IPython Shell

```
<script.py> output:
Hello, World!

In [1]: |
```

Great job!

Solution

Submit

script.py

```
1 # change this code
2 mystring = "hello"
3 myfloat = 10.0
4 myint = 20
5
6 # testing code
7 if mystring == "hello":
8     print("String: %s" % mystring)
9 if isinstance(myfloat, float) and myfloat == 10.0:
10     print("Float: %f" % myfloat)
11 if isinstance(myint, int) and myint == 20:
12     print("Integer: %d" % myint)
```

IPython Shell

```
<script.py> output:
String: hello
Float: 10.000000
Integer: 20

In [1]: |
```

Great job!

Solution

Submit

that the index is zero-based, so if you want to access the second item in the list, its index will be 1.

solution.py

```
3 names = ["John", "Eric", "Jessica"]
4
5 # write your code here
6 numbers.append(1)
7 numbers.append(2)
8 numbers.append(3)
9
10 strings.append('hello')
11 strings.append('world')
12 second_name = names[1]
13
14
15 # this code should write out the filled arrays
16 # and the second name in the names list (Eric).
17 print(numbers)
18 print(strings)
```

IPython Shell

```
<script.py> output:
[1, 2, 3]
['hello', 'world']
The second name on the names list is ['Eric']

<script.py> output:
[1, 2, 3]
['hello', 'world']
The second name on the names list is [1]

<script.py> output:
[1, 2, 3]
['hello', 'world']
The second name on the names list is Eric
```

Great Job!

Submit

concatenating the two lists you have created.

```
script.py
1 x = object()
2 y = object()
3
4 # TODO: change this code
5 x_list = [x]*10
6 y_list = [y]*10
7 big_list = x_list + y_list
8
9 print("x_list contains %d objects" % len(x_list))
10 print("y_list contains %d objects" % len(y_list))
11 print("big_list contains %d objects" % len(big_list))
12
13 # testing code
14 if x_list.count(x) == 10 and y_list.count(y) == 10:
15     print("Good work!")
```

IPython Shell

```
<script.py> output:
x_list contains 10 objects
y_list contains 10 objects
big_list contains 20 objects
Almost there...
Great!
```

In [1]: |

Good work!

```
script.py
1 data = ("John", "Doe", 53.44)
2 format_string = "Hello %s %s. Your current balance is %s."
3
4
5 print(format_string % data)
```

IPython Shell

```
<script.py> output:
Hello John Doe. Your current balance is $53.44.

<script.py> output:
Hello John Doe. Your current balance is $53.44.

<script.py> output:
Hello John Doe. Your current balance is $53.44.

<script.py> output:
Hello John Doe. Your current balance is $53.44.

<script.py> output:
Hello John Doe. Your current balance is $53.44.
```

Great work!

Try to fix the code to print out the correct information by changing the string.

```
script.py  solution.py
1 s = "Strings are awesome!"
2 # Length should be 20
3 print("Length of s = %d" % len(s))
4
5 # First occurrence of "a" should be at index 8
6 print("The first occurrence of the letter a = %d" % s.index("a"))
7
8 # Number of a's should be 2
9 print("a occurs %d times" % s.count("a"))
10
11 # Slicing the string into bits
12 print("The first five characters are '%s'" % s[:5]) # Start to 5
13 print("The next five characters are '%s'" % s[5:10]) # 5 to 10
14 print("The thirteenth character is '%s'" % s[12]) # 12 to 13
```

IPython Shell

```
Length of s = 20
The first occurrence of the letter a = 8
a occurs 2 times
The first five characters are 'Strin'
The next five characters are 'gs ar'
The thirteenth character is 'a'
The characters with odd index are 't i g r w s m !'
The last five characters are 'some!'
String in uppercase: STRINGS ARE AWESOME!
String in lowercase: strings are awesome!
String starts with 'Str'. Good!
String ends with 'ome!'. Good!
Split the words of the string: ['Strings', 'are', 'awesome!']
```

Great work!
